Composable BraidTeX notation

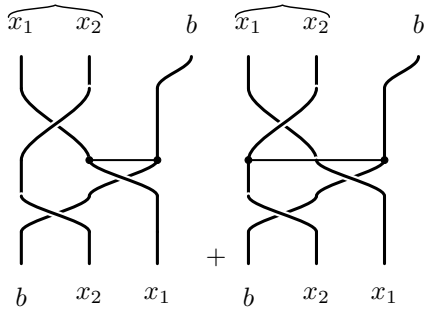

A primitive diagram with a frame, connector, axis ticks, a region label, and a non-topological dotted path:

Vertical stacking is a model-level operation. The separator is distinct from both crossings and horizontal connectors:

Operadic substitution replaces one selected input strand with an inserted braid. Since the outer connector touches that strand, `connector=all` requests separate attachment alternatives:

Formal diagram sums can be written independently and then composed with other expressions:
